

Deviation

Emphasise variations (+/-) from a fixed reference point. Typically the reference point is zero but it can also be a target or a long-term average. Can also be used to show sentiment (positive/neutral/negative).

Example FT uses

Trade surplus/deficit, climate change

Correlation

Show the relationship between two or more variables. Be mindful that, unless you tell them otherwise, many readers will assume the relationships you show them to be causal (i.e. one causes the other).

Example FT uses

Inflation & unemployment, income & life expectancy

Ranking

Use where an item's position in an ordered list is more important than its absolute or relative value. Don't be afraid to highlight the points of interest.

Example FT uses

Wealth, deprivation, league tables, constituency election results

Distribution

Show values in a dataset and how often they occur. The shape (or 'skew') of a distribution can be a memorable way of highlighting the lack of uniformity or equality in the data.

Example FT uses

Income distribution, population (age/sex) distribution

Change over Time

Give emphasis to changing trends. These can be short (intra-day) movements or extended series traversing decades or centuries: Choosing the correct time period is important to provide suitable context for the reader.

Example FT uses

Share price movements, economic time series

Part-to-whole

Show how a single entity can be broken down into its component elements. If the reader's interest is solely in the size of the components, consider a magnitude-type chart instead.

Example FT uses

Fiscal budgets, company structures, national election results

Magnitude

Show size comparisons. These can be relative (just being able to see larger/bigger) or absolute (need to see fine differences). Usually these show a 'counted' number (for example, barrels, dollars or people) rather than a calculated rate or per cent.

Example FT uses

Commodity production, market capitalisation

Spatial

Used only when precise locations or geographical patterns in data are more important to the reader than anything else.

Example FT uses

Locator maps, population density, natural resource locations, natural disaster risk/impact, catchment areas, variation in election results

Flow

Show the reader volumes or intensity of movement between two or more states or conditions. These might be logical sequences or geographical locations.

Example FT uses

Movement of funds, trade, migrants, lawsuits, information; relationship graphs.

Diverging stacked bar

Surplus/deficit filled line

Line + Column

Connected scatterplot

XY heatmap

Ordered column

Ordered proportional symbol

Slope

Boxplot

Population pyramid

Cumulative curve

Column

Visual vocabulary

Designing with data

There are so many ways to visualise data - how do we know which one to pick? Use the categories across the top to decide which data relationship is most important in your story, then look at the different types of chart within the category to form some initial ideas about what might work best. This list is not meant to be exhaustive, nor a wizard, but is a useful starting point for making informative and meaningful data visualisations.
